

1. **Systole is described as:** Ventricle contraction, the pulmonic and aortic valve are open.
2. **Diastole is described as:** The heart relaxing/refilling. The tricuspid and bicuspid valve are open
3. **Heart tissue gets fed during..:** diastole
4. **body tissue gets fed during..:** systole
5. **Coronary Sinus:** an open space in the aorta for blood to flow. Attaches to coronary arteries that feed the heart
6. **What is the SA node?:** The primary pacemaker of the hearts ECS. beats at 60-100 bpm
7. **What is the AV node?:** The "bouncer" for ventricles. Beats at 40-60 bpm
8. **What is the bundle of his?:** The beginning of ventricular ECS. beats at 20-40 bpm.
9. **What do the bundle branches beat at?:** 20-40 bpm
10. **What do the purkinje fibers beat at?:** 20-40bpm
11. **what ventricle has an abundance of perkinje fibers?:** Left ventricle
12. **What is depolarization?:** electrical discharge triggering muscle contraction and pumping blood
13. **What is repolarization?:** Relaxation/recharging of the heart
14. **What is a p wave on an EKG?:** The SA node firing off
15. **What is the space between the p wave and the QRS complex?:** The av node
16. **What is the qrs complex?:** represents depolarization and contraction (bundle of his, bundle branches, perkinje fibers)
17. **Frank sterlings law:** stroke volume of the heart increases in response to an increase in the volume of blood filling the heart (cardiac output, stretch, and squish)
18. **What are the 2 shockable rythms?:** Vfib, pulseless Vtach
19. **What is our bodies high pressure system?:** Left side of the heart, aorta, arteries
20. **What is our low pressure system?:** Right side of the heart, vena cava, veins
21. **Returning from the superior vena cava, where does our blood flow?:** Through the right atrium, tricuspid valve, right ventricle, and pulmonic valve
22. **Coming from the pulmonary artery, where does our blood flow?:** Left atrium, bicuspid valve, left ventricle, aortic valve, aorta.
